Syllabus: Actuarial Accounting 1

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
AC1	2014UCHAAC	Actuarial Accounting 1	DSE	3

Course Objective

The aim of this course is to

- provide a basic understanding of corporate finance
- provide knowledge of the instruments used by companies to raise finance

Course Outcome

On successful completion of this course, student should be able to

CO1: understand how companies are governed and structured (Level: Understand)

CO2: suggest appropriate ways to finance a company (Level: Analyse)

CO3: understand how to calculate company's taxable income (Level: Understand)

CO4: evaluate projects (Level: Evaluate)

Syllabus: Actuarial Accounting 1(Theory)

Modules at a Glance

Sr. No.	Topics	No. of lectures
Module1	Corporate Governance, Corporate Organization and Business Types	15
Module2	Financing of Corporates and Taxation:	15
Module3	Issue of Shares, Reward Policy for Shareholders, Mergers and Acquisition	15
Module4	Project Evaluation	15
	Total	60

Detailed Syllabus

Module	Topics	No. of Lectures
1	<p>Corporate Governance, Corporate Organisation and Business Types (Employability, Skill Development)</p> <ul style="list-style-type: none"> • purpose and process of regulating the financial reporting information of incorporated entities • key principles of corporate governance and the regulation of companies • relationship between finance and the real resources and objectives of an organisation • relationship between the stakeholders in an organisation(including lenders and investors) • role and effects of the capital markets • maximisation of shareholder wealth as the main goal of financial management in a company • problems relating to the maximisation of shareholder wealth in practice: social responsibility concerns, agency problems and divergent objectives • the strategies employed by managers to maximize shareholder wealth • determinants of value and the actions managers can take to influence value • the distinctive characteristics of different types of business structures: sole traders, partnerships, limited companies and limited liability partnerships as business entities • different types of loan and share capital • authorised and issued share capital • economic advantages and disadvantages of a limited company as a business entity • the main differences between a private and public company 	15
2	<p>Financing of Corporates and Taxation (Employability, Entrepreneurship, Skill Development)</p>	15

	<ul style="list-style-type: none"> • Types of medium term company finance: <ul style="list-style-type: none"> ○ hire purchase ○ credit sale ○ leasing ○ bank loans • Types of short term company finance: <ul style="list-style-type: none"> ○ bank overdrafts ○ trade credit ○ factoring ○ bills of exchange ○ commercial paper • Alternative methods of raising finance outside the regular banking system including <ul style="list-style-type: none"> ○ shadow banking ○ direct project financing ○ crowd-funding ○ micro-finance • Basic principles of personal taxation of income and capital gains • Basic principles of corporate taxation • Different systems of company taxation from the points of view of an individual shareholder and the company • Basic principles of double taxation relief • Understanding of the characteristics of the principal forms of financial instrument issued or used by companies and the ways in which they may be issued. • Reasons a company might have for seeking a quotation on the stock exchange • The characteristics of <ul style="list-style-type: none"> ○ debenture stocks ○ unsecured loan stocks ○ Eurobonds ○ preference shares ○ ordinary shares ○ convertible unsecured loan stocks ○ convertible preference shares ○ warrants ○ floating rate notes ○ subordinated debt ○ options issued by companies • The characteristics and possible uses by a non-financial company of: <ul style="list-style-type: none"> ○ financial futures ○ options ○ interest rate and currency swaps 	
3	Issue of Shares, Reward Policy for Shareholders, Mergers and Acquisition: (Employability, Skill Development)	15

	<ul style="list-style-type: none"> • Methods of obtaining a quotation for securities: <ul style="list-style-type: none"> ○ introduction ○ placing ○ offer for sale ○ offer for sale by tender ○ offer for subscription • New issues to existing shareholders: <ul style="list-style-type: none"> ○ scrip issue ○ rights issue • Role of underwriting in the issue of securities. • Factors to be considered by a company when deciding on its capital structure • Effect of the capital structure of a company on the market valuation of the company • Effect of taxation on the capital structure used by a company • Principal factors that a company should consider in setting dividend policy • Alternative ways of distributing profits, such as buybacks • Effect of the dividend policy on the market valuation of a company • Companies growth with the different ways of company restructuring • Relationship between growth and profitability • Constraints on a firm's growth • Motives for mergers and acquisitions <ul style="list-style-type: none"> ○ Characteristics of a merger ○ Methods of evaluating a target company ○ Steps that a buyer will usually take in a leveraged buyout • Cost of Capital of a company <ul style="list-style-type: none"> ○ Concept ○ Impact of nature of investment projects • Weighted average cost of capital of a company 	
4	Project Evaluation (Employability, Entrepreneurship, Skill Development)	15

	<ul style="list-style-type: none"> • Methods to determine the viability of a capital project • Cash flow projections and techniques to estimate cashflows • Methods commonly used to evaluate risky investments including simulation and certainty equivalents • Issues in establishing the required rate of return for a capital project • Factors underlying the choice of discount rate within project assessment including: <ul style="list-style-type: none"> ○ the assumptions and limitations in the use of the weighted average cost of capital ○ the allowance for leverage ○ the allowance for risk • Methods for identifying the risks that may be present for different types of project • Techniques for ascertaining the probability of occurrence of different risks over varying timescales and the financial impact of occurrence • Techniques for ascertaining the distribution of the possible financial outcomes of a capital project

Examination: Total Marks 100

- Continuous Internal examination shall carry 40% weight (40 marks). It would involve a Power Point Presentation (15marks), a written test under no supervision carrying 20 marks and Class participation carrying 5 marks.
- External examination of 2 hours' duration shall carry 60% weight (60 marks). It shall have 4 questions each with 15 marks. Internal options may be present.

- In the theory examination, a candidate is permitted to use a designated, non-programmable scientific calculator and a specified Actuarial Tables Book.
- Passing shall be independent in Internal Component called Continuous Assessment (CA) and External Component called End Examination (EE).

A student must score at least 40% marks in each component in order to pass in the subject.

Syllabus: Actuarial Statistics 1A

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
AS1A	2012UCHAAS	Actuarial Statistics 1A (Theory and Practical)	CC	4+2

Course Objective

The aim of this course is to provide a grounding in mathematical and statistical techniques that are of particular relevance to actuarial work.

Course Outcome

On successful completion of this course, student should be able to

- CO1: Calculate various statistical measures and interpret them (Level: Apply)
- CO2: Summarise data using appropriate statistical and graphical presentation (Level: Analyse, Apply)
- CO3: Calculate probabilities of simple and compound events (Level: Evaluate)
- CO4: Define random variables and determine their distributions in various actuarial applications (Level: Analyse)
- CO5: Describe the essential features of statistical distributions (Level: Understand)
- CO6: Determine generating functions (Level: Apply)
- CO7: Calculate probabilities and other measures from standard discrete and standard continuous distributions (Level: Evaluate)

Detailed Syllabus

Module	Topics	No. of Lectures
1	Summary Statistics and Probability (Employability, Skill development)	15
	<ul style="list-style-type: none"> • Data types and Presentation: Frequency distribution, tabular, graphical and diagrammatic presentation • Data interpretation • Summary Measures: Measures of central tendency, location, dispersion, skewness, kurtosis <i>and</i> moments • Probability using Classical approach, Empirical approach and Axiomatic approach • Probability of compound events using Addition theorem, Multiplication theorem and Bayes' theorem 	
2	Discrete Random Variables and Discrete Distributions (Employability, Skill development)	15
	<ul style="list-style-type: none"> • Discrete random variable, probability mass function, cumulative distribution function, calculation of probability • Expectation, variance, median, mode, moments and other measures. Properties of Expectation and Variance • Standard Discrete Distributions: Discrete Uniform, Bernoulli's, Binomial, Poisson, Geometric Type I and Type II, Negative Binomial Type I and Type II, Hypergeometric. Their Key characteristics and Calculation of Probability (Using Actuarial Tables and otherwise) • Generating Functions: Probability Generating Function, Moment Generating Function and Cumulant Generating Function. Their key properties, determination of these functions and their use in finding various other measures • Joint Discrete Probability Distribution: Joint, Marginal and Conditional Probability functions, Joint CDF, Covariance and Correlation Coefficient, Joint Moment Generating Function 	

3	Continuous Random Variables and Continuous Distributions (Employability, Skill development)	15
	<ul style="list-style-type: none"> • Continuous random variable, probability density function, cumulative distribution function, survival function, calculation of probability • Expectation, variance, median, mode, moments and other measures • Standard Continuous Distributions: Rectangular, Exponential, Gamma, Beta I, Beta II, Normal, Log Normal, Chi-square, t, F, Pareto, Weibul, Burr. Their Key characteristics and Calculation of Probability, Percentiles (Using Actuarial Tables and otherwise), Generating functions • Central Limit theorem and its applications • Joint Discrete Probability Distribution: Joint, Marginal and Conditional Probability functions, Joint CDF, Covariance and Correlation Coefficient, Joint Moment Generating Function • Conditional Expectation, Conditional Variance and their key result 	
4	Data Analysis (Employability, Skill development)	15
	<ul style="list-style-type: none"> • Exploratory Data Analysis involving calculation of summary statistics and data visualization • Pearson's, Spearman's and Kendall's measures of correlation for bivariate data • Principal Component Analysis • Random sampling and sampling distributions of sample mean, sample variance, sample proportion • Fisher-Cochran's theorem, Student's t and Snedecor's F statistics and their distributions

Under Academic Autonomy and Credit, Grading and
Semester System

With effect from Academic Year 2019- 20

Nagindas Khandwala College

Topics are same as in theory

Course Outcome

On successful completion of this course, student should be able to use scientific calculator, spreadsheet software to

- Calculate various statistical measures and Interpret them (Level: Evaluate, Apply, Analyse)
- Summarise data using appropriate statistical analysis, descriptive statistics and graphical presentation. (Level: Evaluate, Apply, Analyse)
- Calculate probabilities of simple and compound events (Level: Evaluate)
- Calculate probabilities and other measures from standard discrete and standard continuous distributions (Level: Evaluate)
- Perform data analysis including principal component analysis A student should carry out practical exercises to achieve the above mentioned competence. (Level: Evaluate, Apply, Analyse)

Examination: Total Marks 50

- Continuous Internal examination shall carry 40% weight (20 marks). It would involve Journal assessment (35% weight) and class participation (5% weight).
- End examination carrying 60% weight shall be of 4 hours. The examination will involve Viva (20% weight) and an end-exam activity (40% weight). The examiners shall evaluate the performance based on actual working (20% weight) and end-results (20% weight).
- The practical examination shall be evaluated by one external examiner and one internal examiner.
- In this practical examination, a candidate is permitted to use a designated, non-programmable scientific calculator, a computer with Excel, R software and a specified Actuarial Tables Book.

Theory and Practical marks scored by a student shall then be merged in the ratio of 2:1 to convert to a total of 100 marks.

The Passing criteria will apply after the merger of theory and practical marks. A student shall be considered to have PASSED if he/she obtains at least 40% marks in each of CIE and EE component.

Syllabus: Actuarial Statistics 1B

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
AS1B	2013UCHAAS	Actuarial Statistics 1B (Theory and Practical)	CC	4+2

Course Objective

The aim of this course is to provide a grounding in mathematical and statistical techniques leading to inferences that are of particular relevance to actuarial work.

Course Outcome

On successful completion of this subject, a student will be able to:

CO1: describe and apply the principles of statistical inference (Level: Understand, Apply)

CO2: calculate point estimates and interval estimates of parameters under different distribution environments (Level: Evaluate)

CO3: calculate test statistic and perform a test of significance for various parameters under appropriate distributional environments (Level: Evaluate, Analyse)

CO4: describe, apply and interpret the results of the linear regression model and generalised linear models. (Level: Understand, Apply, Analyse)

CO5: explain the fundamental concepts of Bayesian statistics and use them to compute Bayesian estimators. (Level: Understand, Apply)

Syllabus: Actuarial Statistics 1 B Modules at a Glance

Sr. No.	Topics	No. of lectures
Module1	Point and Interval Estimation	15
Module2	Hypothesis Testing and Tests of Significance	15
Module3	Regression Theory and Its Applications	15
Module4	Bayesian Statistics	15
	Total	60

Detailed Syllabus

Module	Topics	No. of Lectures
1	Point and Interval Estimation (Employability, Skill Development)	15
	<ul style="list-style-type: none"> • Define Population, Sample, Parameter, Statistic, Estimator, Estimate, Bias, Mean Square Error, Unbiased Estimator, Efficiency, Sufficiency, Consistency • Methods of Point Estimation: Method of Moments, Method of Percentiles, Method of Maximum Likelihood Estimation, Method of Least Squares, Method of Minimum Chi-square • Properties of M.L.E., Cramer Rao Lower Bound for Variance of an Unbiased Estimator • Bootstrap Method to estimate properties of an estimator • Concept of Confidence Interval, Confidence interval for an unknown parameter using a given sampling distribution • Confidence Interval for Mean, Proportion, Poisson Mean, Difference between means, Variance, Ratio of Variances, Coefficient of Correlation 	
2	Hypothesis Testing and Tests of Significance (Employability, Skill Development)	15
	<ul style="list-style-type: none"> • Concepts of Statistical Hypothesis, Null and Alternative Hypothesis, Simple and Composite Hypothesis, Type I and Type II Errors, Test Statistic, Critical Region, Level of Significance, Power of a test, Test of Significance • Probability-value of a test, Likelihood ratio test • Large Sample Tests as Applications of Normal Distribution: Tests for One/Two Population Mean(s)/Proportion(s) • Large Sample Tests for Population Correlation Coefficient(s) using Fisher's z-transformation • Chi-square Test for (i) one population variance, (ii) goodness of fit, (iii) independence of attributes • t-tests for Mean(s) of One/Two Normal Population Mean(s), Paired t- test, t-test for Significance of Bivariate Normal Population Correlation Coefficient and Regression Coefficient • F-test for (i) comparison of two population variances, (ii) simultaneous equality between several population means (ANOVA) 	

3	Regression Theory and Its Applications (Employability, Skill Development)	15
	<ul style="list-style-type: none"> • Concepts of response variables, explanatory variables • Simple linear regression model with single explanatory variable : derivation of least squares estimates of slope and intercept parameters and their interpretation • Multiple linear regression model with several explanatory variables: derivation of least squares estimates of parameters and their interpretation • Use measures of model fit to select an appropriate set of explanatory variables. • Generalised Linear Model (GLM: Definition of an exponential family of distributions, Its Mean, Variance, Variance Function, Scale Parameter, Link function, Canonical link function of various distributions of the family • GLM: Concept of a variable, a factor taking categorical values and an interaction term. Definition of the linear predictor, illustration of its form for simple models, including polynomial models and models involving factors. • Definition of the deviance and scaled deviance, Estimation of the parameters of a GLM, Choice of a suitable model by using an analysis of deviance and by examining the significance of the parameters, Pearson and Deviance residuals and their use • Apply statistical tests to determine the acceptability of a fitted model: Pearson's Chi-square test and the Likelihood ratio test 	

4	Bayesian Statistics & Data Analysis (Employability, Skill Development)	15
	<ul style="list-style-type: none"> • concepts of prior probability and posterior probability • use of Bayes' Theorem to calculate simple conditional probabilities • concepts of prior distribution, posterior distribution and conjugate prior distribution • derivation of posterior distribution for a parameter in simple cases • concept of a loss function • derivation of Bayesian estimates of parameters using simple loss functions • Explain what is meant by the credibility premium formula and describe the role played by the credibility factor • Explain the Bayesian approach to credibility theory and use it to derive credibility premiums in simple cases • Explain the empirical Bayes' approach to credibility theory and use it to derive credibility premiums in simple cases • Explain the differences between the two approaches and state the assumptions underlying each of them

Syllabus: Mathematics for Actuaries 1

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
MA1	2014UCHAMA	Mathematics for Actuaries 1	DSE	3

Course Objective

The aim of this course is to

- provide a basic understanding of mathematical concepts needed for studying actuarial science

Course Outcome

On successful completion of this course, student should be able to

- CO1: use numerical methods to understand accuracies of calculations (Level: Understand, Apply)
- CO2: apply matrix and determinants for solving equations (Level: Apply)
- CO3: understand the basics of calculus to build on further (Level: Understand)
- CO4: use basic algebraic concepts in actuarial modeling (Level: Apply)
- CO5: apply finite differences and difference equations in actuarial applications (Level: Apply)

Syllabus: Mathematics for Actuaries 1

Modules at a Glance

Sr. No.	Topics	No. of lectures
Module 1	Numerical methods	10
Module 2	Matrices, Determinants and Elementary Calculus	12
Module 3	Algebra	13
Module 4	Finite Differences and their Applications	10
	Total	45

Detailed Syllabus

Module	Topics	No. of Lectures
1	Numerical methods (Skill Development)	10
	<ul style="list-style-type: none"> • Measures of Absolute and Relative Changes • Measures of Absolute and Relative Errors • Linearly interpolating an intermediate value of a function based on two given values • Simple iterative methods to solve a non-linear equation 	
2	Matrices, Determinants and Elementary Calculus (Skill Development)	13
	<ul style="list-style-type: none"> • Vector algebra with simple operations <ul style="list-style-type: none"> ➤ Matrix operations • Determinants and their applications • Mathematical constants & standard functions: <ul style="list-style-type: none"> ➤ Functions: x^n, a^x, e^x, $\ln x$. Definition, basic properties, graphs. Absolute values, Minimum and maximum values. Concepts of limit and continuity 	
3	Algebra (Skill Development)	12
	<ul style="list-style-type: none"> • Solution of simple equations, including simultaneous equations (not necessarily linear) • Use of Matrix Algebra and Determinants in solving Linear Equations • Solution of quadratic equations • Solution of inequalities • Summation of terms (Σ) and Product of terms (π). • Summation of terms in Arithmetic Progression and Geometric Progression • Σr and Σr^2 where r represents a natural number ranging from 1 to n. • Binomial expansions of $(a + b)^n$ where n is a positive integer and $(1 + x)^p$ where p is a real number with condition for convergence. 	
4	Finite Differences and their Applications (Skill Development)	10

	<ul style="list-style-type: none"> • Operators: E, Δ, B. • Finite differences and their tables • Applications to estimation of missing number. • Newton's and Lagrange's Formulae • Applications to interpolation and extrapolations • Solution of Simple Difference equations • Their applications in Markov Chain and other problems

Examination: Total Marks 100

- Continuous Internal examination shall carry 40% weight (40 marks). It would involve a Power Point Presentation (15marks), a written test under no supervision carrying 20 marks and Class participation carrying 5 marks.
- External examination of 2 hours' duration shall carry 60% weight (60 marks). It shall have 4 questions each with 15 marks. Internal options may be present.
- In the theory examination, a candidate is permitted to use a designated, non-programmable scientific calculator and a specified Actuarial Tables Book.
- Passing shall be independent in Internal Component called Continuous Assessment (CA) and External Component called End Examination (EE).

A student must score at least 40% marks in each component in order to pass in the subject.

Nagindas Khandwala College

Syllabus: R Programming and Analytics

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
RP	2015UCHARP	R Programming and Analytics (Practical)	SEC	4+2

Course Objective

- Gain a foundational understanding of business analytics using R programming
- Master the R programming and understand how various statements are executed in R

Course Outcome: On successful completion of this course, a student shall be able to

CO1: Gain an in-depth understanding of data structure used in R and learn to import/export data in R (Level: Understand)

CO2: Define, understand and use the various apply functions and DPLYR functions (Level: Apply)

CO3: Understand and use the various graphics in R for data visualization (Level: Apply)

CO4: Gain understanding of use of R for calculating statistical measures and interpret them (Level: Understand)

CO5: Apply hypothesis testing methods and regression models using R (Level: Apply)

CO6: Learn and use clustering methods including K-means, DBSCAN, and hierarchical clustering – all using R (Level: Apply)

Syllabus: R Programming and Analytics (Practical)

Nagindas Khandwala College

Detailed Syllabus

Module	Topics	No. of Lectures
1	Random variables and distributions for risk modeling (Employability, Skill Development)	15
	<ul style="list-style-type: none"> • Loss distributions, with and without risk sharing • statistical distributions suitable for modeling individual and aggregate losses and their properties • concepts of excesses (deductibles), reinsurance and retention limits • operation of simple forms of proportional and excess of loss reinsurance • derivation of the distribution and determination of corresponding moments of the claim amounts paid by the insurer and the reinsurer in the presence of excesses(deductibles) and reinsurance. • Estimate the parameters of a failure time or loss distribution when the data is complete, or when it is incomplete, using maximum likelihood and the method of moments. • Fit a statistical distribution to a dataset and calculate appropriate goodness of fit measures. • Compound distributions and their applications in risk modeling (including reinsurance) <ul style="list-style-type: none"> ○ construction of models appropriate for short term insurance contracts in terms of the numbers of claims and the amounts of individual claims ○ Compound Poisson distribution, its characteristics and its applications related to aggregate losses ○ derivation of the mean, variance, moment generating function and coefficient of skewness for compound Binomial, compound Poisson and compound Negative binomial distributions 	
2	Introduction to Copulas and Extreme Value Theory (Employability)	15

	<ul style="list-style-type: none"> • Copulas <ul style="list-style-type: none"> ○ copula as a multivariate distribution function which is a function of the marginal distribution functions of its variates and its implications for analysis ○ meaning of the terms dependence or concordance, upper and lower tail dependence and use of tail dependence in selecting a copula suitable for modeling particular types of risk ○ Gaussian copula and the Archimedean family of copulas • Extreme Value Theory <ul style="list-style-type: none"> ○ Extreme value distributions, suitable for modeling the distribution of severity of loss and their relationships ○ Calculation of various measures of tail weight and interpretation of the results to compare the tail weights 	
3	Time Series Models-I (Employability, Skill Development)	15
	<ul style="list-style-type: none"> • Concepts underlying time series models <ul style="list-style-type: none"> ○ general properties of stationary, I(0), and integrated, I(1), univariate time series ○ stationary random series ○ a filter applied to a stationary random series ○ backwards shift operator, backwards difference operator ○ characteristic equation of time series and its roots • Basic properties of following time series models: <ul style="list-style-type: none"> ○ autoregressive (AR) ○ moving average (MA) ○ autoregressive moving average (ARMA) ○ autoregressive integrated moving average (ARIMA) 	
4	Advanced concepts and Applications of Time Series and Machine Learning (Employability, Skill Development)	15

	<ul style="list-style-type: none"> • Advanced concepts of time series <ul style="list-style-type: none"> o concept and properties of discrete random walks and random walks with normally distributed increments, both with and without drift o basic concept of a multivariate autoregressive model o co-integrated time series o Markov property of time series and illustrations o methodology to rearrange a univariate time series model as a multivariate Markov model. • Applications of time series models <ul style="list-style-type: none"> o identification, estimation and diagnosis of a time series model o the criteria for choosing between models and the diagnostic tests to be applied to the residuals of a time series after estimation o other non-stationary, non-linear time series models. o simple applications of a time series model, including random walk, autoregressive and co-integrated models as applied to security prices and other economic variables o deterministic forecasts from time series data, using simple extrapolation and moving average models, applying smoothing techniques and seasonal adjustment when appropriate (including Box-Jenkins methodology) • Elementary Principles and Applications of Machine learning <ul style="list-style-type: none"> o main branches of machine learning o illustrations of the types of problems typically addressed by machine learning o application of high-level concepts relevant to learning from data o examples of key supervised and unsupervised machine learning techniques o difference between regression and classification o difference between generative and discriminative models o use of appropriate software to apply machine learning techniques (e.g. penalised regression and decision trees) to simple problems o demonstrate an understanding of the perspectives of statisticians, data scientists, and other quantitative researchers from non-actuarial backgrounds

Syllabus And Question Paper Pattern Of

First Year Semester II

2. Actuarial Statistics 2A [Practical]

Under Academic Autonomy and Credit, Grading and Semester System

With effect from Academic Year 2020- 21

Nagindas Khandwala College

Practical on Actuarial Statistics 2A (30 lectures)

Course Outcome

On successful completion of this course, student should be able to use scientific calculator, spreadsheet software, R studio (if required) to

CO1: calculate moments and cumulative probabilities for loss distributions (Level: Evaluate)

CO2: calculate the estimates of the parameters of a failure time or loss distribution when the data is complete, or when it is incomplete, using maximum likelihood and the method of moments (Level: Evaluate, Apply)

CO3: fit a statistical distribution to a dataset and calculate appropriate goodness of fit measures (Level: Apply, Analyse)

CO4: calculate various measures of tail weight and interpret the results to compare the tail weights (Level: Apply)

CO5: calculate sample autocorrelation coefficients and use them for estimating parameters in a time series model (Level: Evaluate, Apply)

CO6: calculate forecasts based on time series models (Level: Apply)

CO7: use appropriate software to apply machine learning techniques (Level: Apply)

A student should carry out practical exercises to achieve the above mentioned competence

Practical Examination: Total Marks 50

- Continuous Internal examination shall carry 40% weight (20 marks). It would involve Journal assessment (35% weight) and class participation (5% weight).
- End examination carrying 60% weight shall be of 4 hours. The examination will involve Viva (20% weight) and an end-exam activity (40% weight). The examiners shall evaluate the performance based on actual working (20% weight) and end- results (20% weight).
- The practical examination shall be evaluated by one external examiner and one internal examiner.
- In this practical examination, a candidate is permitted to use a designated, non-programmable scientific calculator, a computer with Excel, R software and a specified Actuarial Tables Book.

Theory and Practical marks scored by a student shall then be merged in the ratio of 2:1 to convert to a total of 100 marks.

The Passing criteria will apply after the merger of theory and practical marks. A student shall be considered to have PASSED if he/she obtains at least 40% marks in each of CIE and EE components.

Modules at a Glance

Sr. No.	Topics	No. of lectures
Module 1	Stochastic Processes and Markov Chains	15
Module 2	Markov Processes and Their Applications	15
Module 3	Survival models	15
Module 4	Calculation of Exposed to Risk and Graduation	15
	Total	60

Detailed Syllabus

Module	Topics	No. of Lectures
1	Stochastic Processes and Markov Chains (Employability, Skill Development)	15
	<ul style="list-style-type: none"> • Description, classification and basic characteristics of stochastic processes <ul style="list-style-type: none"> ○ definition of a general stochastic process and a counting process ○ classification a stochastic process according to time and value and examples of each type ○ simple random walk ○ possible applications of mixed processes ○ characteristics: stationary and weakly stationary, Markov property, white noise, filtration • Markov chain and its Applications <ul style="list-style-type: none"> ○ essential features of a Markov chain model ○ Chapman-Kolmogorov equations that represent a Markov chain ○ stationary distribution for a Markov chain in simple cases ○ a system of frequency based experience rating in terms of a Markov chain and other simple applications ○ a time inhomogeneous Markov chain model and describe simple applications ○ use of Markov chain as a tool for modeling and show how 	
2	Markov Processes and Their Applications (Employability, Skill Development)	15

	<ul style="list-style-type: none"> ○ Markov Processes <ul style="list-style-type: none"> ○ definition, time homogeneous and time inhomogeneous cases ○ essential features of a Markov process model ○ definition of Poisson process, derivation of the distribution of the number of events in a given time interval, derivation of the distribution of inter-event times, and application of these results ○ derivation of the Kolmogorov equations for a Markov process with time independent and time/age dependent transition intensities ○ solution of the Kolmogorov equations in simple cases ○ simple survival models, sickness models and marriage models in terms of Markov processes and other simple applications ○ Kolmogorov equations for a model where the transition intensities depend not only on age/time, but also on the duration of stay in one or more states ○ sickness and marriage models in terms of duration dependent Markov processes and other simple applications ○ uses of Markov jump processes as a tool for modeling and show how they can be simulated 	
3	Survival models (Employability, Skill Development)	15

	<ul style="list-style-type: none"> • Concept of survival models • model of lifetime or failure time from age x as a random variable • consistency condition between the random variable representing lifetimes from different ages. • cumulative distribution function and density functions of the random future lifetime • survival function, the force of mortality or hazard rate and relationships between them • actuarial symbols ${}_t p_x$ and ${}_t q_x$ and derive integral formulae for ${}_t p_x$ in terms of force of mortality • Gompertz and Makeham laws of mortality • curtate future lifetime from age x and its probability function • the symbols e_x and e^0_x and an approximate relation between them • expected value and variance of the complete and curtate future lifetimes and derive expressions for them <ul style="list-style-type: none"> • Two-state model of a single decrement and compare its assumptions with those of the random lifetime model • Estimation procedures for lifetime distributions • ways in which lifetime data might be censored • the estimation of the empirical survival function in the absence of censoring, and what problems are introduced by censoring • Kaplan-Meier (or product limit) estimator of the survival function in the presence of censoring, its computation and estimate of its variance • Nelson-Aalen estimator of the cumulative hazard rate in the presence of censoring, its computation and estimate of its variance • Models for proportional hazards and their application to estimate the impact of covariates on the hazard • Cox model for proportional hazards, derivation of the partial likelihood estimate in the absence of ties, and the asymptotic distribution of the partial likelihood estimator • Derivation of Maximum likelihood estimators for constant transition intensities with a well drawn observational plan in respect of a finite number of individuals observed during a finite period of time, and other resulting statistics, including the waiting times • their asymptotic joint distribution • the Poisson approximation to the estimator in the case of a single decrement 	
4	Calculation of Exposed to Risk and Graduation (Employability, Skill Development)	15

	<ul style="list-style-type: none"> • Estimation of transition intensities dependent on age (exact or census) <ul style="list-style-type: none"> ○ importance of dividing the data into homogeneous classes, including subdivision by age and sex ○ principle of correspondence and its fundamental importance in the estimation procedure ○ the data needed for the exact calculation of a central exposed to risk (waiting time) depending on age and sex ○ calculation of a central exposed to risk given the above data ○ estimates of transition probabilities, including in the single decrement model the actuarial estimate based on the simple adjustment to the central exposed to risk. ○ the assumptions underlying the census approximation of waiting times ○ concept of the rate interval ○ Develop census formulae given age at birthday where the age may be classified as next, last, or nearest relative to the birthday as appropriate, and the deaths and census data may use different definitions of age ○ Specify the age to which estimates of transition intensities or probabilities apply • Graduation and graduation tests <ul style="list-style-type: none"> ○ Concept, need, objective of graduation and desirable characteristics of graduated rates ○ Methods of Graduation: Graphical method, Parametric formula method, Standard Table based method, Spline functions method ○ Graduation tests for <ul style="list-style-type: none"> ➤ smoothness ➤ adherence <ul style="list-style-type: none"> ▪ overall goodness ▪ consistent bias ▪ detecting the presence of individual ages where the fit is poor ▪ detecting the consistency of the “shape” of the crude estimates and the standard table ○ For each test describe: <ul style="list-style-type: none"> ➤ formulation of the hypothesis ➤ test statistic ➤ distribution of the test statistic using approximations where appropriate ➤ calculation of the test statistic and conclusion thereof ○ Describe how the above tests should be amended to allow for the presence of duplicate policies 	
--	---	--

	<ul style="list-style-type: none"> • Mortality projection <ul style="list-style-type: none"> ○ the approaches to the forecasting of future mortality rates based on extrapolation, explanation and expectation, and their advantages and disadvantages ○ Lee-Carter, age-period-cohort, and p-spline regression models for forecasting mortality. ○ main sources of error in mortality forecasts

Topics

Course Outcome

On successful completion of this course, student should be able to use scientific calculator, spreadsheet software, R studio (if required) to

- CO1: calculate probabilities pertaining to simple stochastic process like simple random walk (Level: Evaluate)
- CO2: calculate multistep and steady-state probabilities using Markov Chain model (Level: Apply)
- CO3: calculate probabilities, expected waiting time in a state, expected time to reach from one state to another and other measures for Markov model (Level: Evaluate)
- CO4: calculation of probability, mean pertaining to lifespan based on different lifetime patterns (Level: Evaluate)
- CO5: calculate the Kaplan-Meier (or product limit) estimate of the survival function in the presence of censoring and estimate its variance (Level: Evaluate)
- CO6: calculate the Nelson-Aalen estimate of the cumulative hazard rate in the presence of censoring and estimate its variance (Level: Evaluate)
- CO7: apply Cox regression model to estimate proportionate hazards of two dissimilar lives (Level: Apply)
- CO8: compute maximum likelihood estimators for the constant transition intensities in Markov models using transition frequency data (Level: Analyse)
- CO9: obtain estimates of central exposed to risk and hence estimates of transition probabilities in single decrement models (Level: Analyse)
- CO10: carry out graduation by different standard methods (Level: Analyse)
- CO11: carry out statistical tests of graduated rates for smoothness and adherence including tests for overall fit, presence of bias (Level: Analyse)
- CO12: use an appropriate computer software package to apply Lee- Carter, age-period-cohort and p-spline regression models (Level: Apply)

A student to carry out practical exercises to achieve the above mentioned competence.

Practical Examination: Total Marks 50

- Continuous Internal examination shall carry 40% weight (20 marks). It would involve Journal assessment (35% weight) and class participation (5% weight).
- End examination carrying 60% weight shall be of 4 hours. The examination will involve Viva (20% weight) and an end-exam activity (40% weight). The examiners shall evaluate the performance based on actual working (20% weight) and end- results (20% weight).
- The practical examination shall be evaluated by one external examiner and one internal examiner.
- In this practical examination, a candidate is permitted to use a designated, non-programmable scientific calculator, a computer with Excel, R software and a specified Actuarial Tables Book.

Theory and Practical marks scored by a student shall then be merged in the ratio of 2:1 to convert to a total of 100 marks.

The Passing criteria will apply after the merger of theory and practical marks. A student shall be considered to have PASSED if he/she obtains at least 40% marks in each of CIE and EE component.

Nagindas Khandwala College (Autonomous)

Syllabus and Question Paper Pattern Of

First Year Semester II

5. Advanced Excel with Macros [Practical]

Under Academic Autonomy and Credit, Grading and
Semester System

With effect from Academic Year 2020-21

Syllabus: Advanced Excel with Macros [Practical]

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
ASEX	2025UCHAEX	Advanced Excel with Macros [Practical]	SEC	4

Course Objective

This course is aiming at providing grounding in Excel and its advanced features including various **Excel** functions useful in actuarial analytics and enable building Excel macros using visual basic.

Course Outcome

On successful completion of this course, student should be able to

CO1: Demonstrate knowledge of Utility, Specifications (**Knowledge**)

CO2: Creating and Operating on worksheets: Entering data, editing data, Window view controls, working with cells and ranges, Introducing Tables, formatting worksheets, using and creating Templates, printing from worksheets (**Create, Apply**)

CO3: Demonstrate Working with formats and functions: Introducing formulas and functions (**Knowledge**)

CO4: Creating formulas using functions useful for text manipulation, date and time related applications, counting and summing, formulas to LookUp values, useful for financial and statistical applications and formulas with array functions (**Create**)

CO5: Creating charts and graphics: create and edit charts of the following types: Column, Bar, Line, Pie, XY charts (**Create**)

CO6: Use Advanced Features: Creating and using outlines, linking and consolidating worksheets, sharing data with other applications, analyzing data using MS Query with external database files, performing what-if analysis, analyzing data using Goal Seek and Solver (**Apply**)

CO7: Demonstrate Programming Ability in EXCEL with VBA using VBA sub-procedures and VBA functions, Create VBA Macros, record actions to create them, write VBA Code. (**Apply**)

A student to carry out practical exercises (particularly related to actuarial work) to achieve the above mentioned competence.

Syllabus: Advanced Excel with Macros [Practical]

Nagindas Khandwala College

Syllabus: Environmental Studies

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
ES	2021UCHAES	Environmental Studies	AECC	3

Course Objective

To provide a basic understanding of environment around us in terms of natural resources, institutions and people around us, changes appearing in the environment, measuring their impact, assessment of risk and some methods of managing such risks.

Course Outcome:

On successful completion of this course, a student shall be able to

CO1: Describe what is importance of environmental study (Level: Knowledge)

CO2: State the natural resources around us (Level: Understand)

CO3: Describe ecosystems and their characteristics (Level: Understand)

CO4: Describe biodiversity and its significance (Level: Understand)

CO5: Describe different types of pollution and their impact (Level: Knowledge)

CO6: Discuss social issues and environment (Level: Knowledge)

CO7: Describe how human population is affected by environmental issues (Level: Understand)

CO8: Describe actuarial and statistical models useful in assessing certain environmental risks and methods to deal with those risks (Level: Apply)

Syllabus: Environmental Studies

Topics

Course Objective

The aim of this course is to

- provide a basic understanding of certain mathematical concepts needed for studying actuarial science
- provide basics of machine learning

Course Outcome

On successful completion of this course, student should be able to

- CO1: understand apply differential calculus in actuarial analysis (Level: Apply)
- CO2: understand apply integral calculus in actuarial analysis (Level: Apply)
- CO3: understand certain more theories of calculus (Level: Knowledge)
- CO4: understand basics of machine learning (Level: Knowledge)

Syllabus: Mathematics for Actuaries 2 (Theory) Modules at a Glance

Sr. No.	Topics	No. of lectures
Module 1	Differential Calculus	15
Module 2	Integral Calculus	15
Module 3	More Applications of Calculus	15
Module 4	Machine Learning	15
	Total	60

Detailed Syllabus

Module	Topics	No. of Lectures
1	Differential Calculus (Skill Development)	15
	<ul style="list-style-type: none"> • Derivative as rate of change. Derivative as gradient of a curve. • Derivative of simple functions: x^n, a^x, e^x, $\ln x$. • Derivatives of sums, products, quotients and “functions of a function”. • The concept of a higher-order (repeated) derivative • Application of derivative to find the maximum or minimum value of a function over a specified range • Identify the nature of stationary points • The meaning of a partial derivative, notations, evaluation. • Extreme values of functions of two variables 	
2	Integral Calculus (Skill Development)	15
	<ul style="list-style-type: none"> • Meaning of indefinite integral as the anti-derivative of a function and the meaning of a definite integral as the limit of a sum of infinitesimal elements. • The interpretation of a definite integral as the area under a graph • Integration of the standard functions x^n, ax and e^x. • Solution of indefinite and definite integrals by inspection, by identifying and applying an appropriate substitution, by integration by parts, by using simple partial fractions where the fractions initially have a quadratic denominator or by a combination of these methods • Determine when a definite integral converges 	
3	More Applications of Calculus (Skill Development)	15

	<ul style="list-style-type: none"> State and apply Taylor series and Maclaurin series in their simplest form, including using these to determine the approximate change in a function where the argument is varied by a small amount. Apply the Taylor series expansions for e^x and $\ln(1+x)$ and, in the latter case, determine when the series converges. Concept of Differential equation and solution of $dy/dx + Py = Q$ where P and Q are functions of x. Applications of this solution in Actuarial study. 	
4	Machine Learning (Skill Development)	15

	<p>Understanding of elementary principles of Machine Learning and their applications</p> <ul style="list-style-type: none"> the main branches of machine learning examples of the types of problems typically addressed by Machine Learning. <p>Understanding in detail how to use appropriate software to apply Machine Learning techniques (eg penalised regression and decision trees) to simple problems</p>

 - guaranteed level annuity premium
 - benefit (immediate and deferred)

- Description of Operation of conventional with-profits contracts, in which profits are distributed by the use of regular reversionary bonuses and by terminal bonuses
 - Description of the benefits payable under the above assurance- type contracts

- Description of Operation of conventional unit-linked contracts, in which death benefits are expressed as combination of absolute amount and relative to a unit fund and where maturity benefits can also be guaranteed to a minimum absolute amount or rate of investment return

- Description of Operation of accumulating with-profits contracts, in which benefits take the form of an accumulating fund of premiums, where either:
 - the fund is defined in monetary terms, has no explicit charges, and is increased by the addition of regular guaranteed and bonus interest payments plus a terminal bonus; or
 - the fund is defined in terms of the value of a unit fund, is subject to explicit charges, and is increased by regular bonus additions plus a terminal bonus (Unitised with-profits).
 - In the case of unitised with-profits, the regular additions can take the form of (a) unit price increases (guaranteed and/or discretionary), or (b) allocations of additional units [may be with a guaranteed minimum monetary death benefit]

- Life Table
 - Description of functions l_x and d_x and $l[x]:r$ and $d[x]:r$.
 - Definition of the following probabilities: ${}_n p_x, {}_n q_x, {}_n |m q_x, {}_n |q_x$ and ${}_n p[x]:r, {}_n q[x]:r, {}_n |m q[x]:r, {}_n |q[x]:r$.
 - Expressions for the probabilities in terms of life table functions
- Definition of the assurance and annuity factors
 - Extension of the annuity factors to allow for the possibility that payments are more frequent than annual but less frequent than

	<p>continuous.</p> <ul style="list-style-type: none"> • Understanding of the relations between <ul style="list-style-type: none"> ○ annuities payable in advance and in arrear ○ temporary, deferred and whole life annuities • Understanding of and the use of the relations between <ul style="list-style-type: none"> ○ assurance and annuity factors using equation of value (including their select and continuous equivalents) • Development of the expressions(in the form of sums/integrals)for the means and variances of the present value of the benefit payments under various assurance and annuity contracts, assuming constant deterministic interest rate
4	<p>Multiple Decrement and Multiple Life Models (Employability, Skill Development)</p> <ul style="list-style-type: none"> • Mortality study involving two lives <ul style="list-style-type: none"> ○ Definition and use of assurance and annuity functions involving two lives where cashflows dependent upon the death or survival of either or both of two lives including the cases where functions dependent upon a fixed term as well as age • Describe and illustrate methods of valuing cashflows that are contingent upon multiple transition events • Definition of health insurance and description of health insurance contracts with simple premium and benefit structures. • Valuation of a cashflow, contingent upon multiple transition events using a multiple-state Markov Model, in terms of the forces and probabilities of transition. • Development of expressions for the expected present values of cashflows that are contingent upon multiple transition events, including simple health insurance premiums and benefits and their calculations in simple cases (including cases where regular premiums and sickness benefits are payable continuously and assurance benefits are payable immediately on transition. • Description and use of methods of projecting and valuing expected cashflows that are contingent upon multiple decrement events • Definition of a multiple decrement model as a special case of multiple-state Markov model. • Derivation of dependent probabilities for a multiple decrement model in terms of given forces of transition, assuming forces of transition are constant over single years of age • Derivation of forces of transition from given dependent probabilities, assuming forces of transition are constant over single years of age.

Examination: Total Marks 100

- Continuous Internal examination shall carry 25% weight (25 marks). It would involve a written test under no supervision carrying 20 marks and Class participation carrying 5 marks.
- External examination of 2 1/2 hours and 75 marks shall have 5 questions of 15 marks each. Internal options may be provided.
- In the theory examination, a candidate is permitted to use a designated, non-programmable scientific calculator and a specified Actuarial Tables Book.
- Passing shall be independent in Internal Component called Continuous Assessment (CA) and External Component called End Examination (EE).

A student must score at least 40% marks in each component in order to pass in the subject.

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
AM1C	1933UCHAM	Actuarial Mathematics 1C	CC	4

Course Objective: The aim of this course is to provide a grounding in the principles of modeling as applied to actuarial work – focusing particularly on deterministic models which can be used to model and value known cashflows as well as those which are dependent on death, survival, or other uncertain risks.

Course Outcome: On successful completion of this course, student should be able to

- CO1: determine premiums for life insurance plans with or without profit (**Analyse**)
- CO2: determine premiums/benefits for benefit plans for individual life coverage plans (**Analyse**)
- CO3: understand reserves and calculate reserves (**Knowledge, Evaluate**)
- CO4: develop capability to perform profit testing to finalise premiums (**Analyse, Apply**)

Theory Examination: Total Marks 100

- Continuous Internal examination shall carry 25% weight (25 marks). It would involve a written test under no supervision carrying 20 marks and Class participation carrying 5 marks.
- External examination of 2 1/2 hours and 75 marks shall have 5 questions of 15 marks each. Internal options may be provided.
- In the theory examination, a candidate is permitted to use a designated, non-programmable scientific calculator and a specified Actuarial Tables Book.

5. Insurance Principles and Designing of Insurance Product (Practical) (Employability, Skill Development)

Objective: The aim of this course is to provide an insight into designing of insurance products.

Course Outcome: After successful completion of this course, student should be able to

- CO1: Understand the sources of ideas to design product (Level: Understand)
- CO2: Conduct a survey to know the available products and their features in the market (Level: Knowledge)
- CO3: Conduct a survey to understand need for different types of products, product features (Level: Understand)
- CO4: Demonstrate the understanding by designing the features of some innovative products in life insurance, annuities, non-life insurance and health insurance (Level: Understand, Analyse, Create)

Contents:

1. Survey of available products
2. Survey of required products/features
3. Design of a life insurance product
4. Design of an annuity product
5. Design of a non-life insurance product
6. Design of a health insurance product

Practical Examination: Total Marks 50

- Continuous Internal examination shall carry 25% weight. It would involve a written test under no supervision carrying 20% weight and Class participation carrying 5% weight.
- End examination carrying 75% weight shall be of 4 hours. The examination will involve Journal (20% weight), Viva (20% weight) and an end-exam activity (35% weight). The examiners shall evaluate the performance based on actual working (20% weight) and end- results (15% weight).
- The practical examination shall be evaluated by one external examiner and one internal examiner.
- In this practical examination, a candidate is permitted to use a designated, non-programmable scientific calculator, a computer with Excel, R software and a specified Actuarial Tables Book.

Theory and Practical marks scored by a student shall then be merged in the ratio of 2:1 to convert to a total of 100 marks.

The Passing criteria will apply after the merger of theory and practical marks. A

Nagindas Khandwala College

student shall be considered to have PASSED if he/she obtains at least 40% marks in each of CIE and EE component.

4

Models for Term Structure of Interest Rates and Credit Risk (Employability, Skill Development)

- Term Structure of Interest Rate Models
 - principal concepts and terms underlying the theory of a term structure of interest rates
 - desirable characteristics of the models for the term-structure of interest rates
 - Application of the term structure of interest rates to modeling various cash flows, including calculating the sensitivity of the value to changes in the term structure
 - the risk-neutral approach to the pricing of zero-coupon bonds and interest-rate derivatives for a general one-factor diffusion model for the risk-free rate of interest
 - the state-price deflators approach to the pricing of zero-coupon bonds and interest-rate derivatives for a general one-factor diffusion model for the risk-free rate of interest
 - Basic Characteristics of the Vasicek model, Cox-Ingersoll-Ross model and Hull-White model for the term-structure of interest rates
 - Limitations of one-factor models

- Simple models for Credit Risk
 - Definition of credit event and recovery rate
 - Different approaches to model credit risk
 - structural models
 - reduced form models
 - intensity-based models
 - Models of Credit Risk
 - Merton model
 - two-state model for credit ratings with a constant transition intensity
 - Jarrow-Lando-Turnbull model for credit ratings
 - generalization of two-state model to incorporate stochastic transition intensity

Examination: Total Marks 100

- Continuous Internal examination shall carry 25% weight (25 marks). It would involve a written test under no supervision carrying 20 marks and Class participation carrying 5 marks.
- External examination of 2 1/2 hours and 75 marks shall have 5 questions of 15 marks each. Internal options may be provided.
- In the theory examination, a candidate is permitted to use a designated, non-programmable scientific calculator and a specified Actuarial Tables Book.
- Passing shall be independent in Internal Component called Continuous Assessment (CA) and External Component called End Examination (EE).

A student must score at least 40% marks in each component in order to pass in the subject..

Syllabus: Actuarial Mathematics 2C

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
AM2C	1943UCHAM	Actuarial Mathematics 2C	CC	4

Objective: The aim of this course is to provide a grounding in the principles of modeling as applied to actuarial work – focusing particularly on deterministic and stochastic liability models and the valuation of financial derivatives. This will enhance ability to communicate with other financial professionals and critically evaluate modern financial theories.

Outcome: On successful completion of this course, student should be able to

CO1: describe ruin situation, calculate ruin probability and determine capital needed to restrict ruin chances (Level: Knowledge, Evaluate, Apply)

CO2: describe, construct, interpret and discuss the models underlying liability valuations (Level: Knowledge, Evaluate, Apply)

CO3: describe, construct, interpret and discuss the models underlying option pricing. (Level: Knowledge, Evaluate, Apply)

Modules at a Glance

Sr. No.	Topics	No. of lectures
Module 1	Ruin theory	15
Module 2	Run-off triangles	15
Module 3	Option pricing and valuations-I	15
Module 4	Option pricing and valuations-II	15
		60

Detailed Syllabus

Sr. No.	Modules / Units
1	<p>Ruin theory (Employability, Skill Development)</p> <ul style="list-style-type: none"> • Aggregate claim process and the cash-flow process for a risk • Application of the Poisson process and the distribution of inter-event times to calculate probabilities of the number of events in a given time interval and waiting times • Definition of Compound Poisson process and calculation of probabilities using simulation • Definition of the probability of ruin in infinite/finite and continuous/discrete time the relationships between the different probabilities of ruin • The Adjustment coefficient and Lundberg's inequality • Effect on the probability of ruin, in both finite and infinite time, of changing parameter values by reasoning or simulation • Calculation of probabilities of ruin by simulation
2	<p>Run-off triangles (Employability, Skill Development)</p> <ul style="list-style-type: none"> • Run-off Triangles to determine future liabilities <ul style="list-style-type: none"> ○ In non-life insurance, concept of reserve and its need, IBNR reserve ○ Definition of development factor and understanding of how a set of assumed development factors can be used to project the future development of a delay triangle ○ Basic chain ladder method for completing the delay triangle using development factors <ul style="list-style-type: none"> ➤ adjustment to make explicit allowance for inflation ○ Average cost per claim method for estimating outstanding claim amounts ○ Bornhuetter-Ferguson method for estimating outstanding claim amounts <ul style="list-style-type: none"> ➤ adjustment to make explicit allowance for inflation ○ Statistical Model for delay triangle <ul style="list-style-type: none"> ➤ assumptions underlying the model for various methods discussed above.

3	<p>Option pricing and valuations-I (Employability, Skill Development)</p> <ul style="list-style-type: none"> • Characteristics of Derivative Securities <ul style="list-style-type: none"> ○ Concepts of arbitrage and a complete market ○ Factors that affect option prices ○ Derivation of specific results for options which are not model dependent: <ul style="list-style-type: none"> ➤ valuation of a forward contract ➤ upper and lower bounds for European and American call and put options ➤ put-call parity • Greeks <ul style="list-style-type: none"> ○ Definitions ○ Uses • The Binomial Model <ul style="list-style-type: none"> ○ Definitions, assumptions, background ○ One-period model ○ Two-period model ○ Derivations of risk neutral probability and current price of the option using binomial tree ○ Use of binomial lattice in deriving option price for multi-period model ○ difference between the real-world measure and the risk-neutral measure ○ state-price deflator approach to pricing and its application in Binomial model ○ five-step procedure for deriving option price using Martingale approach
4	<p>Option pricing and valuations-II (Employability, Skill Development)</p> <ul style="list-style-type: none"> • Black-Scholes derivative-pricing model <ul style="list-style-type: none"> ○ Derivation of the Black-Scholes partial differential equation both in its basic and Garman-Kohlhagen forms ○ Martingale Approach to derive Black-Scholes formula <ul style="list-style-type: none"> ➤ Concepts of complete market, equivalent martingale measure, Martingale representation theorem ➤ Derivation of Black-Scholes option pricing formula by martingale approach by 5-step procedure ➤ Calculation of option prices ➤ the validity of the assumptions underlying the Black-Scholes model ○ Application of Black-Scholes formula to Value basic benefit guarantees

Syllabus: Actuarial Mathematics 2 Practical (Employability, Skill Development)

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
AM2P	1944UCHAM	Actuarial Mathematics 2 (Practical)	CC	4

Course Objective: The aim of this course is to provide a grounding in the principles of modeling as applied to actuarial work – focusing particularly on stochastic asset liability models and the valuation of financial derivatives. These skills are also required to communicate with other financial professionals and to critically evaluate modern financial theories

Course Outcome: On successful completion of this course, student should be able to :

CO1: apply the theories on the behavior of financial markets (Level: Apply)

CO2: calculate different measures of investment risk (Level: Evaluate)

CO3: apply the models underlying asset valuations (Level: Apply)

CO4: apply the models underlying liability valuations (Level: Apply)

CO5: apply the models underlying option pricing (Level: Apply)

Contents:

All topics included in Actuarial Mathematics 2A, 2B and 2C involving numerical calculations can be considered to design practical activities.

Syllabus: Data Analytics

Course Abbreviation	Course Code	Full Course Name	Type of Course	No of Credits
DA	1945UCHADA	Data Analytics (Theory and Practical)	CC	4+2

Objective: The aim of this course is to provide a grounding in the applications of R- programming, Excel and other softwares in business analytics

Outcome: After successful completion of this course, student should be able to

CO1: Demonstrate skills to analyse business problems and solve them with the help of various technological tools including R-Programming, Excel (**Knowledge, Apply, Analyse**)

CO2: Appraise Big Data needs and techniques to tackle them (**Knowledge**)

Modules at a Glance

Sr. No.	Modules	No. of lectures
Module 1	Insurance Analytics	15
Module 2	HR Analytics	15
Module 3	Venture Funds Analytics	15
Module 4	Creditworthiness of Customers	15
	Total	60

Sr. No.	Modules / Units
1	<p>Insurance Analytics (Employability, Entrepreneurship, Skill Development)</p> <p>(a) Life Insurance: Perform predictive analysis to forecast life duration of an insure/ proposer</p> <p>(b) Non-life Insurance(including Health insurance): Predict the time of occurrence of a loss event and size of the loss</p>
2	<p>HR Analytics Entrepreneurship (Employability, Entrepreneurship, Skill Development)</p> <p>HR department is looking for solutions to many a problems such as</p> <ul style="list-style-type: none"> • How to evaluate candidates who have applied for a job • How to evaluate performances of employees and carry out their appraisals for revision of pay, promotion, etc. • Predict how long a given employee may work before quitting or retiring <p>Assess their data needs and how to analyse them.</p>
3	<p>Venture Funds Analytics (Employability, Entrepreneurship, Skill Development)</p> <p>Venture Funds are always looking for new avenues to invest their surplus funds in the start-ups. Help these funds identify the geographies and sectors for its investment to maximise the return. Also help them in zeroising on the available proposals.</p>
4	<p>Creditworthiness of Customers (Employability, Entrepreneurship, Skill Development)</p> <p>Learn how predictive analytics can be used to decide the creditworthiness of customers and whether they</p> <ul style="list-style-type: none"> • can be issued a credit card or not • granted a loan or not and the rate of interest to be charged

4.	Competing on Analytics: The New Science of Winning By Thomas H. Davenport, Jeanne G. Harris	2006	Harvard Business School Press

Examination: Total Marks 100

- Continuous Internal examination shall carry 25% weight (25 marks). It would involve a written test under no supervision carrying 20 marks and Class participation carrying 5 marks.
- External examination of 2 1/2 hours and 75 marks shall have 5 questions of 15 marks each. Internal options may be provided.
- In the theory examination, a candidate is permitted to use a designated, non-programmable scientific calculator and a specified Actuarial Tables Book.

5. **Data Analytics (Practical)** (Employability, Entrepreneurship, Skill Development)

Objective: The aim of this course is to provide a grounding in the applications of R-programming, Excel and other softwares in business analytics

Outcome: After successful completion of this course, student should be able to

CO1: Demonstrate skills to analyse business problems and solve them with the help of various technological tools including R-Programming, Excel (**Apply, Analyse**)

CO2: Appraise Big Data needs and techniques to tackle them (**Apply, Analyse**)

Contents:

Collect data on various applications and carry out the practical exercises analysing these data.

Practical Examination: Total Marks 50

- Continuous Internal examination shall carry 25% weight. It would involve a written test under no supervision carrying 20% weight and Class participation carrying 5% weight.
- End examination carrying 75% weight shall be of 4 hours. The examination will involve Journal (20% weight), Viva (20% weight) and an end-exam activity (35% weight). The examiners shall evaluate the performance based on actual working (20% weight) and end- results (15% weight).
- The practical examination shall be evaluated by one external examiner and one internal examiner.
- In this practical examination, a candidate is permitted to use a designated, non- programmable scientific calculator, a computer with Excel, R software and a specified Actuarial Tables Book.

Theory and Practical marks scored by a student shall then be merged in the ratio of 2:1 to convert to a total of 100 marks.

The Passing criteria will apply after the merger of theory and practical marks. A student shall be considered to have PASSED if he/she obtains at least 40% marks in each of CIE and EE component.
